

CS/ECE/ME532 Period 9 Activity

Estimated Time: 25 minutes for P1, 30 minutes for P2

1. Consider the system of linear equations $\mathbf{X}\mathbf{w} = \mathbf{y}$ where $\mathbf{X} = \begin{bmatrix} 1 & 1 \\ -2 & -2 \end{bmatrix}$, $\mathbf{w} = \begin{bmatrix} w_1 \\ w_2 \end{bmatrix}$ and $\mathbf{y} = \begin{bmatrix} 2 \\ -4 \end{bmatrix}$.

- a) Sketch the set of all \mathbf{w} that satisfy $\mathbf{X}\mathbf{w} = \mathbf{y}$ in the w_1 - w_2 plane. Is the solution unique? What is the value of the squared error $\min_{\mathbf{w}} \|\mathbf{X}\mathbf{w} - \mathbf{y}\|_2^2$?
- b) Use your sketch to find the \mathbf{w} of minimum norm that satisfies the system of equations: $\min_{\mathbf{w}} \|\mathbf{w}\|_2^2$ subject to $\mathbf{X}\mathbf{w} = \mathbf{y}$. Is this solution unique? What makes it unique? What is the value of the squared error $\|\mathbf{X}\mathbf{w} - \mathbf{y}\|_2^2$ at this solution? What is the value of $\|\mathbf{w}\|_2^2$? *Hint:* The equation $\|\mathbf{w}\|_2^2 = c$ describes a circle in \mathbb{R}^2 with radius \sqrt{c} .
- c) Algebraically find the $\hat{\mathbf{w}}$ that solves the Tikhonov-regularized (or ridge regression) problem $\hat{\mathbf{w}} = \arg \min_{\mathbf{w}} \{\|\mathbf{X}\mathbf{w} - \mathbf{y}\|_2^2 + \lambda \|\mathbf{w}\|_2^2\}$ as a function of λ . *Hint:* Recall that

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

- d) Sketch the set solution to the Tikhonov-regularized problem in the w_1 - w_2 plane as a function of λ for $0 < \lambda < \infty$. (Consider the solution for different values of λ in that range.) Find the squared error $\|\mathbf{X}\mathbf{w} - \mathbf{y}\|_2^2$ and norm squared of the solution, $\|\mathbf{w}\|_2^2$ for $\lambda = 0$ and $\lambda = 5$. Compare the squared error and norm squared of the solution to those in part b).

2. Let $\mathbf{X} = \begin{bmatrix} 1 & \gamma \\ 1 & -\gamma \\ 1 & -\gamma \\ 1 & \gamma \end{bmatrix}$.

- a) Show that the columns of \mathbf{X} are orthogonal to each other for any γ .
- b) Express $\mathbf{X} = \mathbf{U}\mathbf{\Sigma}$ where \mathbf{U} is a 4-by-2 matrix with orthonormal columns and $\mathbf{\Sigma}$ is a 2-by-2 diagonal matrix (the non-diagonal entries are zero).

- c) Express the solution to the least-squares problem $\min_{\mathbf{w}} \|\mathbf{X}\mathbf{w} - \mathbf{y}\|_2^2$ as a function of \mathbf{U} , $\mathbf{\Sigma}$, and \mathbf{y} .

- d) Let $\mathbf{y} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 1 \end{bmatrix}$. Find the weights \mathbf{w} as a function of γ . What happens to $\|\mathbf{w}\|_2^2$ as $\gamma \rightarrow 0$?

- e) The ratio of the largest to the smallest diagonal values in $\mathbf{\Sigma}$ is termed the condition number of \mathbf{X} . Find the condition number if $\gamma = 0.1$ and $\gamma = 10^{-8}$. Also find $\|\mathbf{w}\|_2^2$ for these two values of γ .

- f) A system of linear equations with a large condition number is said to be “ill-conditioned”. One consequence of an ill-conditioned system of equations is solutions with large norms as you found in the previous part of this problem. A second consequence is that the solution is very sensitive to small errors in \mathbf{y} such as may

result from measurement error or numerical error. Suppose $\mathbf{y} = \begin{bmatrix} 1 + \epsilon \\ 0 \\ 0 \\ 1 \end{bmatrix}$. Write

$\mathbf{w} = \mathbf{w}_o + \mathbf{w}_\epsilon$ where \mathbf{w}_o is the solution for arbitrary γ when $\epsilon = 0$ and \mathbf{w}_ϵ is the perturbation in that solution due to some error $\epsilon \neq 0$. How does the norm of the perturbation due to $\epsilon \neq 0$, $\|\mathbf{w}_\epsilon\|_2^2$, depend on the condition number? Find $\|\mathbf{w}_\epsilon\|_2^2$ for $\epsilon = 0.01$ and $\gamma = 0.1$ and $\gamma = 10^{-8}$.

- g) Now apply ridge regression, i.e., Tikhonov regularization. Solve for \mathbf{w}_o and \mathbf{w}_ϵ as a function of λ . Find $\|\mathbf{w}_o\|_2^2$ and $\|\mathbf{w}_\epsilon\|_2^2$ for $\lambda = 0.1$, $\epsilon = 0.01$ and $\gamma = 0.1$ and $\gamma = 10^{-8}$. Comment on the impact of regularization.
